

List of identified microservices

1. **Channel Management Service — selected bounded context**
Manages the channel lifecycle, memberships, roles and permissions. It determines which users are allowed to access and interact with a channel.
2. **User Profile Service**
Manages public user profiles and presence information, including display names, avatars and status. Other services reference users through `UserId`.
3. **Realtime Messaging Service**
Accepts, stores and distributes messages in real time. It checks channel access through the Channel Management Service but does not manage memberships or permissions.
4. **Engagement Service**
Manages reactions and other engagement associated with messages. It references messages and users through `MessageId` and `UserId`.
5. **Notification Service**
Consumes domain events from the other services and creates or delivers relevant notifications. It owns notification rules, delivery state and delivery status.
